Def<sup>n</sup> Retraction

If  $A \subset X$ , a retraction of  $X$  onto  $A$  is a continuous map  $r: X \rightarrow A$  such that  $r|_A$  is the identity map of  $A$ ,  $I_A$ .

---

Lemma 55.1

If  $A$  is a retract of  $X$ , then the homomorphism of the fundamental groups induced by ~~the~~  $(?)$

inclusion  $j: A \rightarrow X$  is injective

---

Proof: If  $r: X \rightarrow A$  is a retraction, then the composite map  $r \circ j$  equals the identity map of  $A$ .

It follows that  $r_* \circ j_*$  is the identity map of

$\pi_1(A, a)$ , so that  $j_*$  must be injective.

\*\*\* PROBLEMS \*\*\*

(2)  $r: X \rightarrow A$  where  $r(x) = x$  for all  $x \in A$

I am trying to understand the homomorphism induced by  $r$ ,  $r_*$

[ I understand that  $A \subset X$  but am showing ~~them~~ the sets  $A$  and  $X$  as separate for clarity - so can follow the def<sup>n</sup> of  $h_*$  on page 333 of Munkres (see attachment)

Following Munkres def<sup>n</sup> of  $h_*$  on Page 333 (see attachment) we require that  $r: (X, x_0) \rightarrow (A, x_0)$  is a continuous map that carries the point  $x_0$  of  $X$  to the point  $x_0$  of  $A$ .

Ch 9 - The Fundamental Group

B

\*\*\* PROBLEMS \*\*\* (continued)

(2) continued

$f$  is a loop in  $X$  based at  $x_0$

~~But~~ ~~what~~  
BUT

\* what if the loop  $f$  and (possibly anyway)  $x_0$  are in  $X$  but outside of  $A$  ???

Anyway, continuing - given that  $f$  is a loop in  $X$  based at  $x_0$ , then the composite

$\& r \circ f : I \rightarrow A$  is a loop in  $A$  based at  $x_0$ .

Thus the correspondence  $f \rightarrow r \circ f$  gives rise to a map carrying  $\pi_1(X, x_0)$  into  $\pi_1(A, x_0)$

ie  $r_* : \pi_1(X, x_0) \rightarrow \pi_1(A, x_0)$

Is this correct so far?

\*\*\* PROBLEMS \*\*\*

(3) Argument to form  $j_*$

$j: A \rightarrow X$  where  $j(a) = a$  for all  $a \in A$ .

By a similar argument to the situation with  $r$  and  $r_*$  we have

$$j_* : \pi_1(A, x_0) \rightarrow \pi_1(X, x_0)$$

But we have

$$r_* : \pi_1(X, x_0) \rightarrow \pi_1(A, x_0)$$

Then

~~$$r_* \circ j_* : \pi_1(X, x_0) \rightarrow \pi_1(A, x_0) \rightarrow \pi_1(X, x_0)$$~~

~~↑  
 loops in X  
 start with  
 base point  $x_0$~~

~~↑  
 loops in A  
 - base point  $x_0$~~

~~↑  
 loops in X,  
 base point  $x_0$~~

\*\*\* Problems \*\*\*

---

③ continued

Thus

loops in  $A$ ,  
base point  $x_0$

loops in  $X$ ,  
base points  $x_i$

loops in  
 $A$ , base  
point  $x_0$

$$r_x \circ j_x : \pi_1(A, x_0) \rightarrow \pi_1(X, x_0) \rightarrow \pi_1(A, x_0)$$

$$\text{ie } r_x \circ j_x : \pi_1(A, x_0) \rightarrow \pi_1(A, x_0)$$

(Is all of the above correct???)

I ~~am~~ suspect that  $r_x \circ j_x$  is the identity

map of  $\pi_1(A, a)$  - intuitively it seems so

- but how would you formally show this.

What is the  $\beta$  set of formal & explicit steps  
that show the following

" The composite map  $r \circ j$  equals the identity map  
of  $A \implies r_x \circ j_x$  is the identity map  
of  $\pi_1(A, x_0)$  "

Also, can someone confirm that my reasoning  
above is correct?
