

Voltage Drop

Due to low impedance, the voltage drop of busduct system is lower compared to conventional cable system. Therefore, busduct system is a more efficient power transmission media as compared to conventional cable system.

Voltage Drop Calculation :

$$\Delta V = \sqrt{3} \cdot I (R \cos \phi + X \sin \phi)$$

$$R = R_0 \times \frac{1 + \alpha (55 \times (\frac{I}{I_0})^2 + 20)}{1 + 75\alpha}$$

ΔV = Line-to-Line Voltage Drop (V/m)

I = Load Current (A)

I_0 = Rated Current (A)

$\cos \phi$ = Load Power Factor

$\sin \phi = \sqrt{1 - \cos^2 \phi}$

R = AC resistance at load current (Ω/m)

R_0 = AC resistance at rated current (I_0) (Ω/m)

α = Temperature coefficient of conductor at 20 °C
 $= 3.85 \times 10^{-3}$ (Copper)

X = Reactance (Ω/m)

Voltage Drop

Busduct Rating	Conductor Width (Thickness=6mm)	50 Hz			Voltage Drop at Full Load Current					
		Resistance, R ($\mu\Omega/m$)	Reactance, X ($\mu\Omega/m$)	Impedance, Z ($\mu\Omega/m$)	Power factor ϕ at 50 Hz					
					1.00	0.95	0.90	0.85	0.80	0.75
